#### Abstract

Let $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ be a graph with p vertices and q edges. Let $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2$, $\ldots, \mathrm{p}+\mathrm{q}\}$ be an injective function. For a vertex labeling f , the induced edge labeling $\mathrm{f}^{*}$ (e=uv) is defined by $\mathrm{f}^{*}$ (e) $=\left\lceil\sqrt{\frac{f(u)^{2}+f(u) f(v)+f(v)^{2}}{3}}\right\rceil$ (or) $\left\lfloor\sqrt{\frac{f(u)^{2}+f(u) f(v)+f(v)^{2}}{3}}\right\rfloor$. Then f is called a

 Super Stolarsky-3 Mean labeling if $f(V(G) \cup\{f(e) / e \epsilon E(G)\}=\{1,2, \ldots, p+q\}$.A graph which admits Super Stolarsky-3 Mean labeling is called Super Stolarsky-3 Mean graphs.

In this paper, we investigate Super Stolarsky-3 Mean labeling of Quadrilateral Snake graphs.
Keywords - Graph, Super Stolarsky-3 Mean labeling, Quadrilateral Snake graph, Double Quadrilateral Snake graph, Triple Quadrilateral Snake graph, Four Quadrilateral Snake graph.

## 1. INTRODUCTION

All graphs $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ with p vertices and q edges are finite, simple and undirected. For a detailed survey of graph labeling we refer Gallian (2017) [1] . For all other standard terminologies and notations we follow Harary[2]. S.S. Sandhya, E.Ebin Raja Merly and S.Kavitha introduced a new type of Labeling called "Stolarsky-3 Mean

Labeling of Graphs" in [4]. In this paper we prove that Double quadrilateral Snake, Triple Quadrilateral Snake, Four Quadrilateral Snake graphs are Super Stolarsky-3 Mean labeling of graphs. The following definitions and theorems are useful for our present investigation.

A walk in which all the vertices $u_{1}, u_{2}, \ldots, u_{n}$ are distinct is called a path. It is denoted by $P_{n}$. A Quadrilateral snake $\boldsymbol{Q}_{\boldsymbol{n}}$ is obtained from a path $u_{1}, u_{2}, \ldots, u_{n}$ by joining $u_{i}$ and $u_{i+1}$ to two new vertices $v_{i}$ and $w_{i}$ respectively and then joining $v_{i}$ and $w_{i}$. That is, every edge of a path is replaced by a cycle $C_{4}$. Double Quadrilateral snake $\mathbf{D}\left(\boldsymbol{Q}_{\boldsymbol{n}}\right)$ consists of two Quadrilateral snakes that have a common path. Triple Quadrilateral snake $\mathbf{T}\left(\boldsymbol{Q}_{n}\right)$ consists of three Quadrilateral snakes that have a common path. Four Quadrilateral snake $\mathbf{F}\left(\boldsymbol{Q}_{\boldsymbol{n}}\right)$ consists of Four Quadrilateral snakes that have a common path.

Definition 1.1: Let $G=(V, E)$ be a graph with $p$ vertices and $q$ edges. Let $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ be an injective function. For a vertex labeling f , the induced edge labeling $\mathrm{f}^{*}(\mathrm{e}=\mathrm{uv})$ is defined by
f* (e) $=\left\lceil\sqrt{\frac{f(u)^{2}+f(u) f(v)+f(v)^{2}}{3}}\right\rceil$ (or) $\left\lfloor\sqrt{\frac{f(u)^{2}+f(u) f(v)+f(v)^{2}}{3}}\right\rfloor$. Then f is called a
Super Stolarsky-3 Mean labeling if $f(V(G) \cup\{f(e) / e \in E(G)\}=\{1,2, \ldots, p+q\}$. A graph which admits Super Stolarsky-3 Mean labeling is called Super Stolarsky-3 Mean graphs.

Theorem 1.2 [5]: Quadrilateral Snake $Q_{n}$ is Super Stolarsky-3 Mean graph (S.S. Sandhya, E.Ebin Raja Merly and S.Kavitha).

## 2. MAIN RESULTS

Theorem 2.1: Double Quadrilateral Snake D $\left(Q_{n}\right)$ is Super Stolarsky-3 Mean graph. Proof:

Let $\mathrm{D}\left(Q_{n}\right)$ be the Double Quadrilateral Snake graph.
Consider a path $u_{1}, u_{2}, \ldots, u_{n}$.
To Construct $\mathrm{D}\left(Q_{n}\right)$. Join $u_{i}$ and $u_{i+1}$ to four new vertices $v_{i}, w_{i}, x_{i}, y_{i}, 1 \leq \mathrm{i} \leq \mathrm{n}-1$.
Define a function $\mathbf{f}: \mathrm{V}\left(\mathrm{D}\left(Q_{n}\right)\right) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by
$\mathbf{f}\left(u_{i}\right)=12 \mathrm{i}-7,1 \leq i \leq n$.
$\mathbf{f}\left(v_{i}\right)=12 \mathrm{i}-8,1 \leq i \leq n$.
$\mathbf{f}\left(w_{i}\right)=12 \mathrm{i}-4,1 \leq i \leq n$.
$\mathbf{f}\left(x_{i}\right)=12 \mathrm{i}-7,1 \leq i \leq n$.
$\mathbf{f}\left(y_{i}\right)=12 \mathrm{i}-1,1 \leq i \leq n$.

Then the edges are labeled with
$\mathbf{f}\left(u_{i} u_{i+1}\right)=12 \mathrm{i}-5,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} v_{i}\right)=12$ i $-10,1 \leq i \leq n-1$.
$\mathbf{f}\left(v_{i} w_{i}\right)=12$ i $-6,1 \leq i \leq n-1$.
$\mathbf{f}\left(w_{i} u_{i+1}\right)=12 i-2,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} x_{i}\right)=12 \mathrm{i}-9,1 \leq i \leq n-1$.
$\mathbf{f}\left(x_{i} y_{i}\right)=12 \mathrm{i}-3,1 \leq i \leq n-1$.
$\mathbf{f}\left(y_{i} u_{i+1}\right)=12 \mathrm{i}, 1 \leq i \leq n-1$.
Then we get distinct edge labels.
Hence $\mathrm{D}\left(Q_{n}\right)$ is Super Stolarsky-3 Mean graph.
Example 2.2: The SuperStolarsky-3 Mean labeling of $\mathrm{D}\left(Q_{4}\right)$ is given below.

Figure 1
Theorem 2.3: Triple Quadrilateral Snake $\mathrm{T}\left(Q_{n}\right)$ is Super Stolarsky-3 Mean graph.

## Proof:

Let $\mathrm{T}\left(Q_{n}\right)$ be the Triple Quadrilateral Snake graph.
Let $P_{n}$ be the path $u_{1}, u_{2}, \ldots, u_{n}$.
To Construct $\mathrm{T}\left(Q_{n}\right)$. Join $u_{i}$ and $u_{i+1}$ to six new vertices $v_{i}, w_{i}, v_{i}{ }^{\prime}, w_{i}{ }^{\prime}$ and $x_{i}, y_{i}, 1 \leq \mathrm{i} \leq \mathrm{n}-1$.
Define a function $\mathbf{f}: \mathrm{V}\left(\mathrm{T}\left(Q_{n}\right)\right) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by
$\mathbf{f}\left(u_{i}\right)=17 \mathrm{i}-16,1 \leq i \leq n$.
$\mathbf{f}\left(v_{i}\right)=17 \mathrm{i}-13,1 \leq i \leq n$.
$\mathbf{f}\left(w_{i}\right)=17 \mathrm{i}-6,1 \leq i \leq n$.
$\mathbf{f}\left(v_{i}{ }^{\prime}\right)=17 \mathrm{i}-11,1 \leq i \leq n$.
$\mathbf{f}\left(w_{i}{ }^{\prime}\right)=17 \mathrm{i}-5,1 \leq i \leq n$.
$\mathbf{f}\left(x_{i}\right)=17 \mathrm{i}-9,1 \leq i \leq n$.
$\mathbf{f}\left(y_{i}\right)=17 \mathrm{i}-1,1 \leq i \leq n$.
Then the edges are labeled with
$\mathbf{f}\left(u_{i} u_{i+1}\right)=17 \mathrm{i}-7,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} v_{i}\right)=17 \mathrm{i}-15,1 \leq i \leq n-1$.
$\mathbf{f}\left(\mathrm{u}_{\mathrm{i}} v_{i^{\prime}}\right)=17 \mathrm{i}-14,1 \leq i \leq n-1$.
$\mathbf{f}\left(v_{i} w_{i}\right)=17 \mathrm{i}-10,1 \leq i \leq n-1$.
$\mathbf{f}\left(\boldsymbol{v}_{\boldsymbol{i}}{ }^{\prime} w_{\boldsymbol{i}^{\prime}}\right)=17 \mathrm{i}-8,1 \leq i \leq n-1$.
$\mathbf{f}\left(w_{i} u_{i+1}\right)=17 i-3,1 \leq i \leq n-1$.
$\mathbf{f}\left(w_{i}^{\prime} u_{i+1}\right)=17 \mathrm{i}-2,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} x_{i}\right)=17 \mathrm{i}-12,1 \leq i \leq n-1$.
$\mathbf{f}\left(x_{i} y_{i}\right)=17 \mathrm{i}-4,1 \leq i \leq n-1$.
$\mathbf{f}\left(y_{i} u_{i+1}\right)=17 \mathrm{i}, 1 \leq i \leq n-1$.
Then we get distinct edge labels.
Hence T $\left(Q_{n}\right)$ is Super Stolarsky-3 Mean graph.
Example 2.4: The SuperStolarsky-3 Mean labeling of $\mathrm{T}\left(Q_{4}\right)$ is given below.

Figure 2
Theorem 2.5: Four Quadrilateral Snake $\mathrm{F}\left(Q_{n}\right)$ is Super Stolarsky-3 Mean graph.

## Proof:

Let $\mathrm{F}\left(Q_{n}\right)$ be the Four Quadrilateral Snake graph.
Let $P_{n}$ be the path $u_{1}, u_{2}, \ldots, u_{n}$.

To construct $\mathrm{F}\left(Q_{n}\right)$, Join $u_{i}$ and $u_{i+1}$ to eight new vertices $v_{i}, w_{i}, v_{i}{ }^{\prime}, w_{i}{ }^{\prime}$, $x_{i}, y_{i}$ and $x_{i^{\prime}}, y_{i^{\prime}}, \quad 1 \leq \mathrm{i} \leq \mathrm{n}-1$.
Define a function $\mathbf{f}: \mathrm{V}\left(\mathrm{F}\left(Q_{n}\right)\right) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by
$\mathbf{f}\left(u_{i}\right)=22 \mathrm{i}-21,1 \leq i \leq n$.
$\mathbf{f}\left(v_{i}\right)=22 \mathrm{i}-18,1 \leq i \leq n$.
$\mathbf{f}\left(w_{i}\right)=22 \mathrm{i}-10,1 \leq i \leq n$.
$\mathbf{f}\left(v_{i}{ }^{\prime}\right)=22 \mathrm{i}-16,1 \leq i \leq n$.
$\mathbf{f}\left(w_{i^{\prime}}\right)=22 \mathrm{i}-7,1 \leq i \leq n$.
$\mathbf{f}\left(x_{i}\right)=22 \mathrm{i}-11,1 \leq i \leq n$.
$\mathbf{f}\left(y_{i}\right)=22$ i $-1,1 \leq i \leq n$.
$\mathbf{f}\left(x_{i^{\prime}}\right)=22 \mathrm{i}-11,1 \leq i \leq n$.
$\mathbf{f}\left(y_{i}{ }^{\prime}\right)=22$ i $-1,1 \leq i \leq n$.
Then the edges are labeled as
$\mathbf{f}\left(u_{i} u_{i+1}\right)=22 \mathrm{i}-5,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} v_{i}\right)=22$ i $-20,1 \leq i \leq n-1$.
$\mathbf{f}\left(\mathrm{u}_{\mathrm{i}} v_{i^{\prime}}\right)=22 \mathrm{i}-19,1 \leq i \leq n-1$.
$\mathbf{f}\left(v_{i} w_{i}\right)=22 \mathrm{i}-14,1 \leq i \leq n-1$.
$\mathbf{f}\left(\boldsymbol{v}_{\boldsymbol{i}}{ }^{\prime} w_{\boldsymbol{i}}{ }^{\prime}\right)=22 \mathrm{i}-12,1 \leq i \leq n-1$.
$\mathbf{f}\left(w_{i} u_{i+1}\right)=22 i-4,1 \leq i \leq n-1$.
$\mathbf{f}\left(w_{i}{ }^{\prime} u_{i+1}\right)=22 \mathrm{i}-3,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} x_{i}\right)=22 \mathrm{i}-15,1 \leq i \leq n-1$.
$\mathbf{f}\left(u_{i} x_{i^{\prime}}\right)=22 \mathrm{i}-17,1 \leq i \leq n-1$.
$\mathbf{f}\left(x_{i^{\prime}} y_{i^{\prime}}\right)=22 \mathrm{i}-8,1 \leq i \leq n-1$.
$\mathbf{f}\left(x_{i} y_{i}\right)=22 \mathrm{i}-6,1 \leq i \leq n-1$.
$\mathbf{f}\left(y_{i} u_{i+1}\right)=22 \mathrm{i}, 1 \leq i \leq n-1$.
$\mathbf{f}\left(y_{i}{ }^{\prime} u_{i+1}\right)=22 \mathrm{i}-2,1 \leq i \leq n-1$.
Then we get distinct edge labels.
Hence $\mathrm{F}\left(Q_{n}\right)$ is Super Stolarsky-3 Mean graph.

Example 2.6: The SuperStolarsky-3 Mean labeling of $\mathrm{F}\left(Q_{4}\right)$ is given below.

Figure 3

## 3. CONCLUSION

In this paper we discussed Super Stolarsky-3 Mean Labeling behavior of double, triple and Four Quadrilateral Snake graphs. The authors are of the opinion that the study of Super Stolarsky-3 Mean labeling of Quadrilateral Snake graphs shall be quite interesting and also will lead to new results.

## 4. ACKNOWLEDGEMENTS

The authors thank the referees for their valuable comments and suggestions.
